

**Project Objective and Results:**

The aim of the project is to automate current production and data transfer processes in order to reduce repeated manual copying of data, to make implementing changes more convenient and faster, to reduce the production of defective products, and to minimise the release of faulty products from the company.

**Project Summary:**

M ja P Nurst AS is a company based on Estonian capital, whose main activity is the production of various electronic components. Within the production process, numerous drawings and instructions are circulated on paper, which limits the ability to make changes and increases the likelihood of errors. In addition to replacing paper-based materials with digital versions, it is also necessary to integrate different software platforms, so that data transfer takes place automatically rather than by mechanical copying.

**Sustainability of Project Results:**

The solutions foreseen in the project are aimed at improving the company's core business processes and increasing sustainability, and do not include the development of riskier new production lines.
